More Open Doors Means More Vulnerable

Everyone is browsing the web nowadays. Internet Browsers on the market today are built for the general public, equipped with tools to accommodate every aspect of online internet navigation, however, the ability to install plugins, or have added capabilities for online gaming, etc. are not necessarily what a business needs to work in a secure environment. PayServices Butterfly Browser is specifically built for security by eliminating all of those extra "open doors" that most conventional browsers include.

Maximum Security For Your Online Space

The Butterfly Internet Secured Browser by PayServices.com is the first of its kind built and designed for security focused businesses to protect every aspect of their online experience and connections. With Butterfly Browser plugins and add-ons are not able to install and run. Only a limited number doors to plugins and add-ons are open. The Butterfly Browser has many extended capabilities for security and identification purposes to prevent fraud by using Multi-Factor Identification of all connected parties. PayServices also uses PCI-DSS Level 1 scalable secured data servers to protect every aspect of your online browsing to complete, secure and define processes with digital signatures for sharing and exchanging values, contracts, transactions, information, commitments, data and opinions (including digitally signed approvals).

Security Tools For Approved Third Parties

Butterfly Secured Browser is capable of activating the computer's camera with the microphone and reading the data contained on chip cards via a USB card reader. These tools are used by PayServices for added identification purposes and are also available for third party applications that require the same level of flexibility and security. Upon approval by PayServices your web application can use the PayServices security tools by making simple JavaScript calls. For example, one command could be used to ask Butterfly Secured Browser to display the card number of the card currently inserted in a USB card reader, while another command could ask the application to turn on the camera and ask the user to record himself.

Built-in Tools

Butterfly comes built-in with 3 static tabs that are part of the Butterfly Eco-System. These are "PayServices", "Zubybox", and "BigBigBrain".

PayServices.com is the core of the system and the clearing house for all transactions.

Zubybox.com is PayServices' own advanced webmail client with encrypted messages, files sharing, community agenda, and so much more.

BigBigBrain.com is PayServices' Advanced Search Engine allowing you to make secure searches on the web, and much more things to simplify your daily activities that you are welcome to discover by yourself.
